

# An experimental security analysis of an Industrial Robot Controller

**Davide Quarta**, Marcello Pogliani, Mario Polino, Federico Maggi,  
Andrea Maria Zanchettin, Stefano Zanero

San José (CA), May 22nd, 2017 38th IEEE Symposium on Security and Privacy

**POLITECNICO**  
MILANO 1863

DIPARTIMENTO DI ELETTRONICA  
INFORMAZIONE E BIOINGEGNERIA

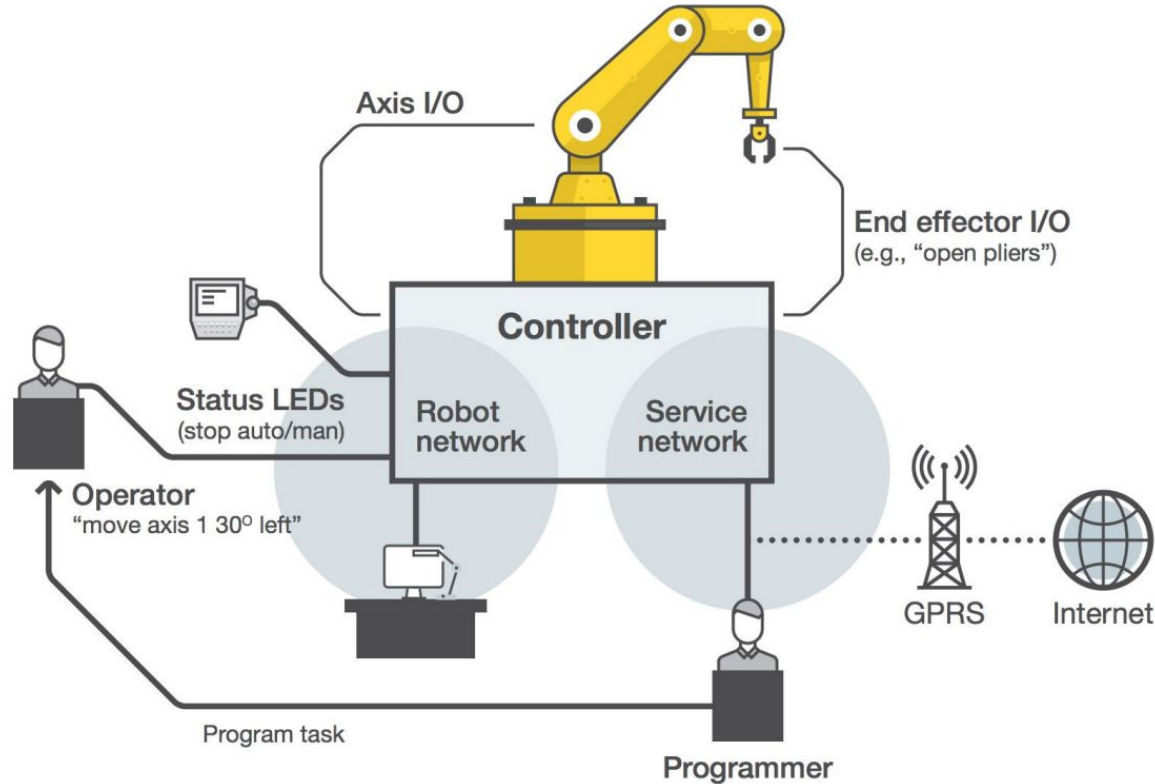

**TREND**  
M I C R O™

# Contents

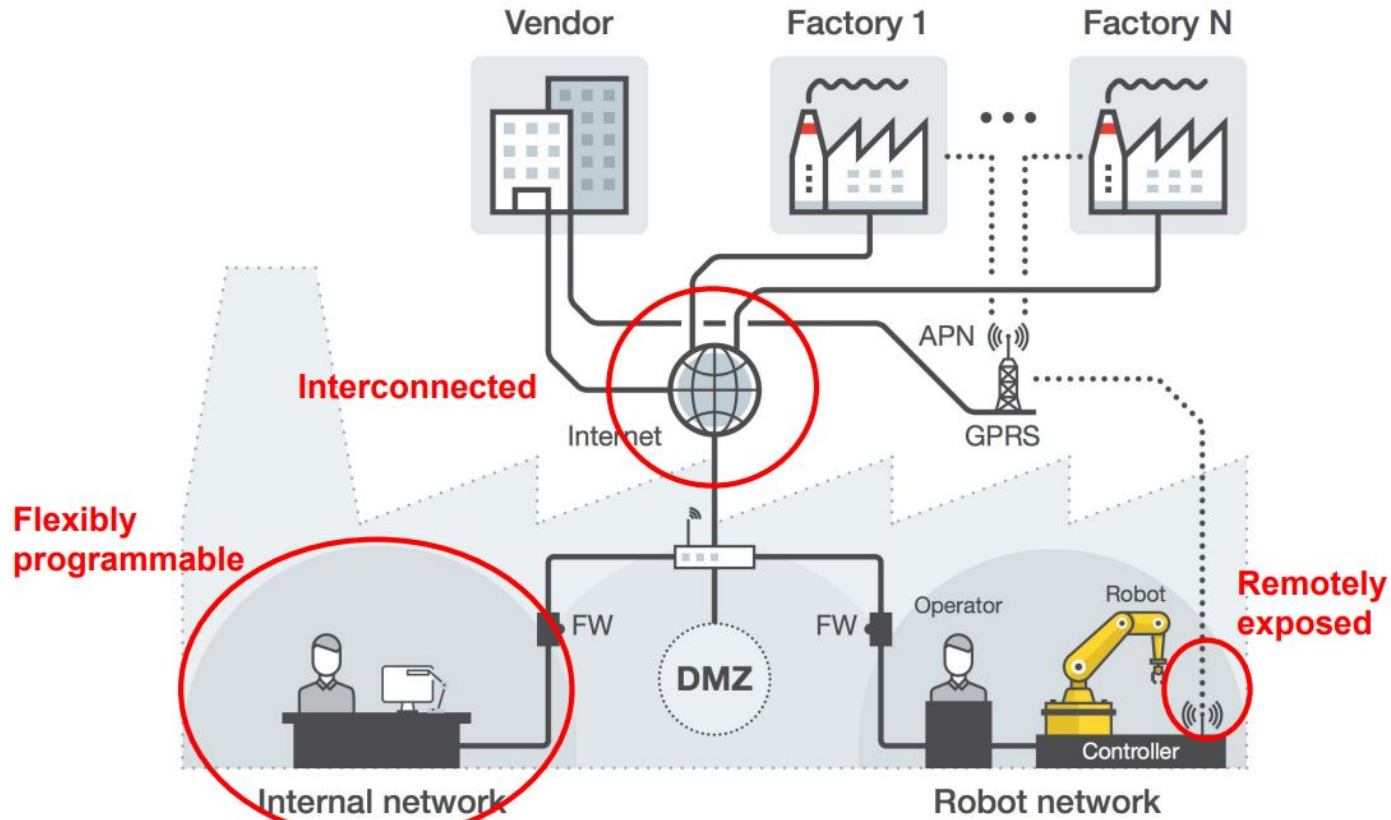

---

- I. Industrial Robot Controller
- II. Motivations
- III. Robot-specific Attacks
- IV. Case studies
- v. Attack POCs
- VI. Conclusion

# Industrial Robot Controller

# Motivations – Industrial 4.0 Trends

# Motivations – Lack of Awareness

---

**Survey:** Robot users vs. system security

50 domain experts—users interviewed: 20 answers

- **28%\*** access control policies *not enforced*
- **30%** robots accessible *over Internet*
- **76%** *never* performed a pentest
- **> 50%** not a *realistic* threat

\* some users did not answer all the questions

# Robot-specific attacks

---

Q. How do we define a robot-specific attack?

A. Need to find Requirements for robots (laws of robotics)

1. **I/O Accuracy**
  - a. Read precise values
  - b. Issue correct/accurate commands
2. **Safety**
  - a. Never harm humans
  - b. Correctly inform operator
3. **Integrity**
  - a. No damage to the robot

*Robot-specific Attack:*

Digital-borne violation of any of these requirements

# Robot-specific attacks

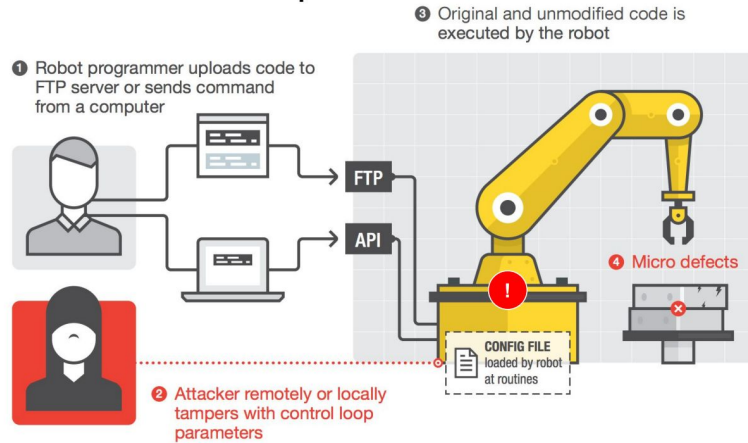

---

## ❖ Attacker Model

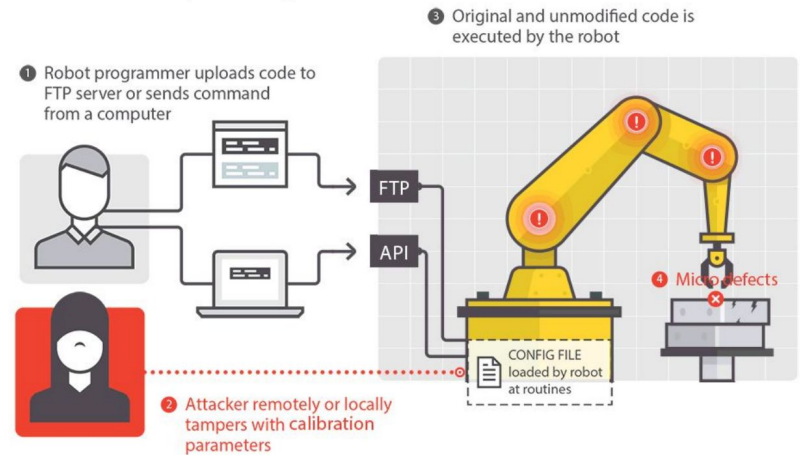

- Target System: Industrial manufacturing robot
- Goal: production outcome altering, physical damage, production plant halting, unauthorized access
- Access Level: network attacker, remote exposure, physical attacker

# Robot-specific Attacks

## Attack 1: Control Loop Alteration

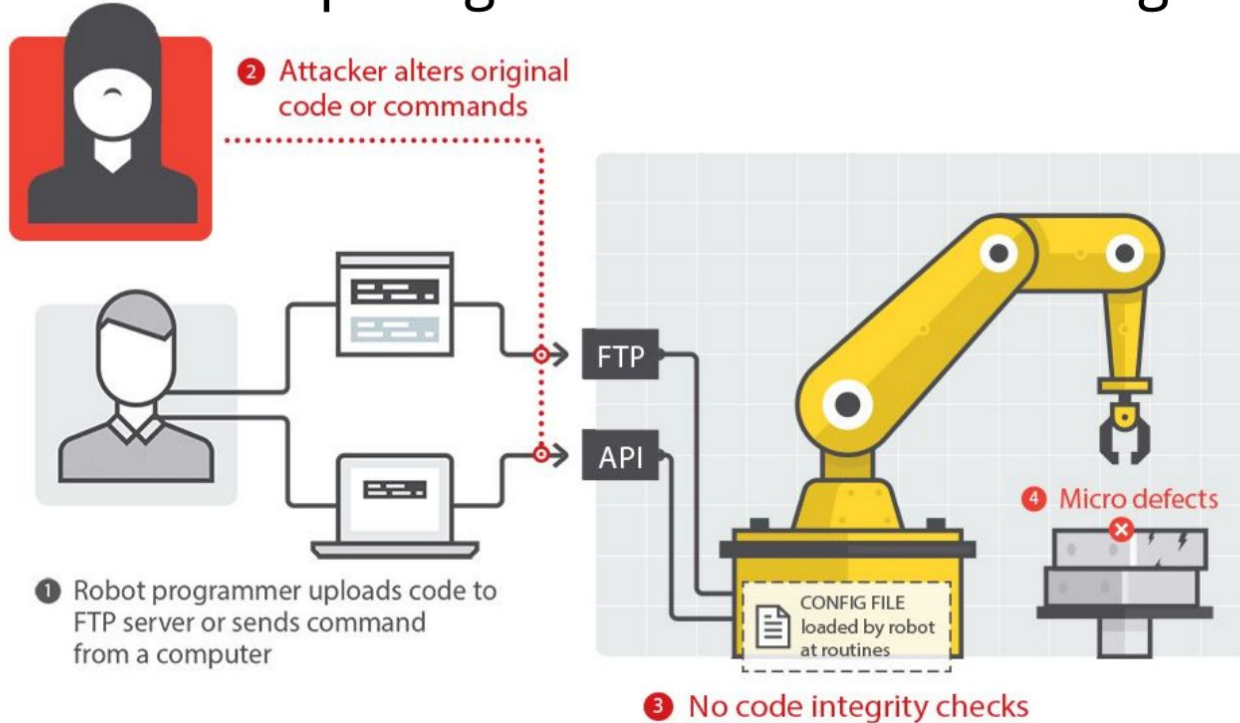

## Attack 2: Tampering with Calibration Parameters

# Robot-specific Attacks

## Attack 3: Tampering with the Production Logic

# Robot-specific Attacks

## Attack 4 & 5: (Perceived) Robot State Alteration

# Robot-specific Attacks

---

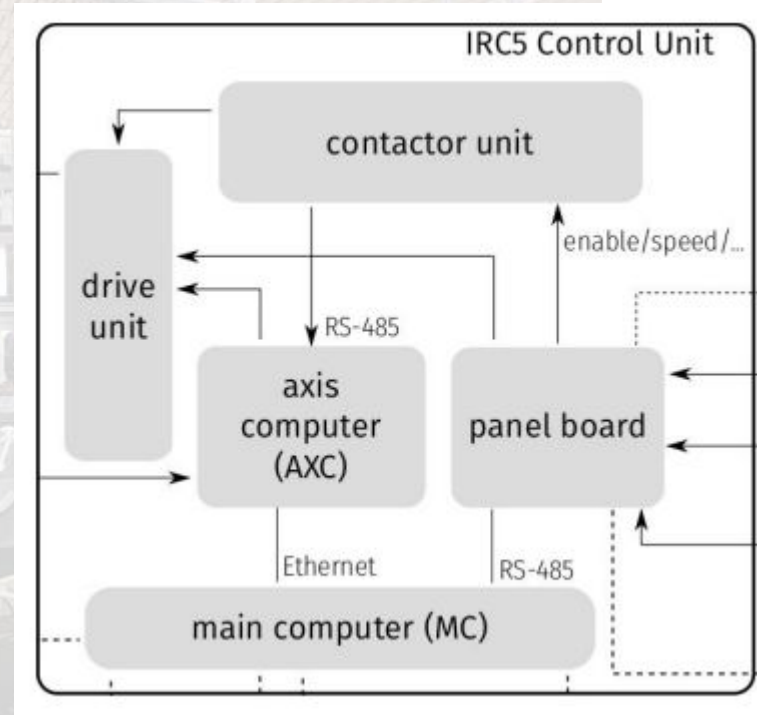

- ◆ From Attacks to Threats Scenarios
  - 1) Production Plant Halting
  - 2) Production Outcome Alteration
  - 3) Physical Damage
  - 4) Unauthorized Access
  - 5) Ransom requests to disclose micro defects

# Case Study

---

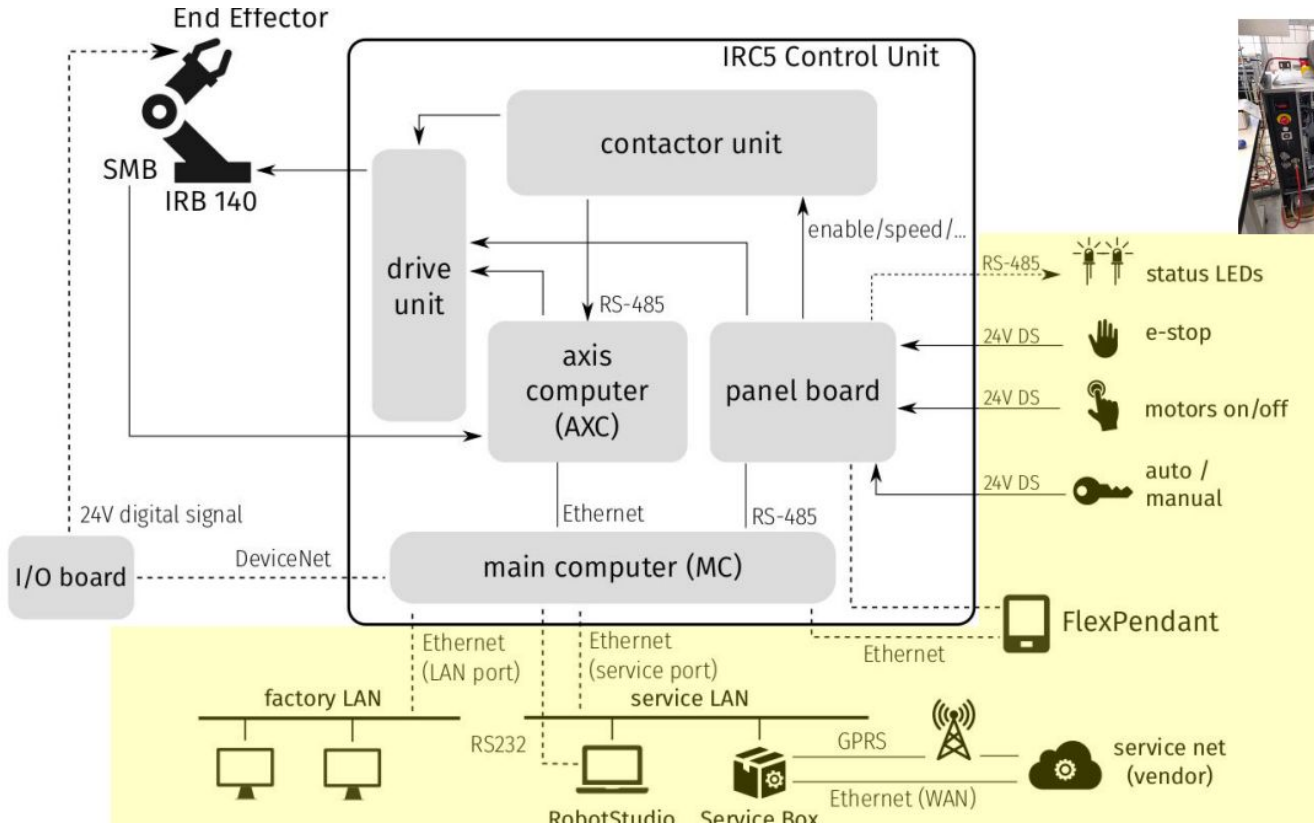

# Case Study

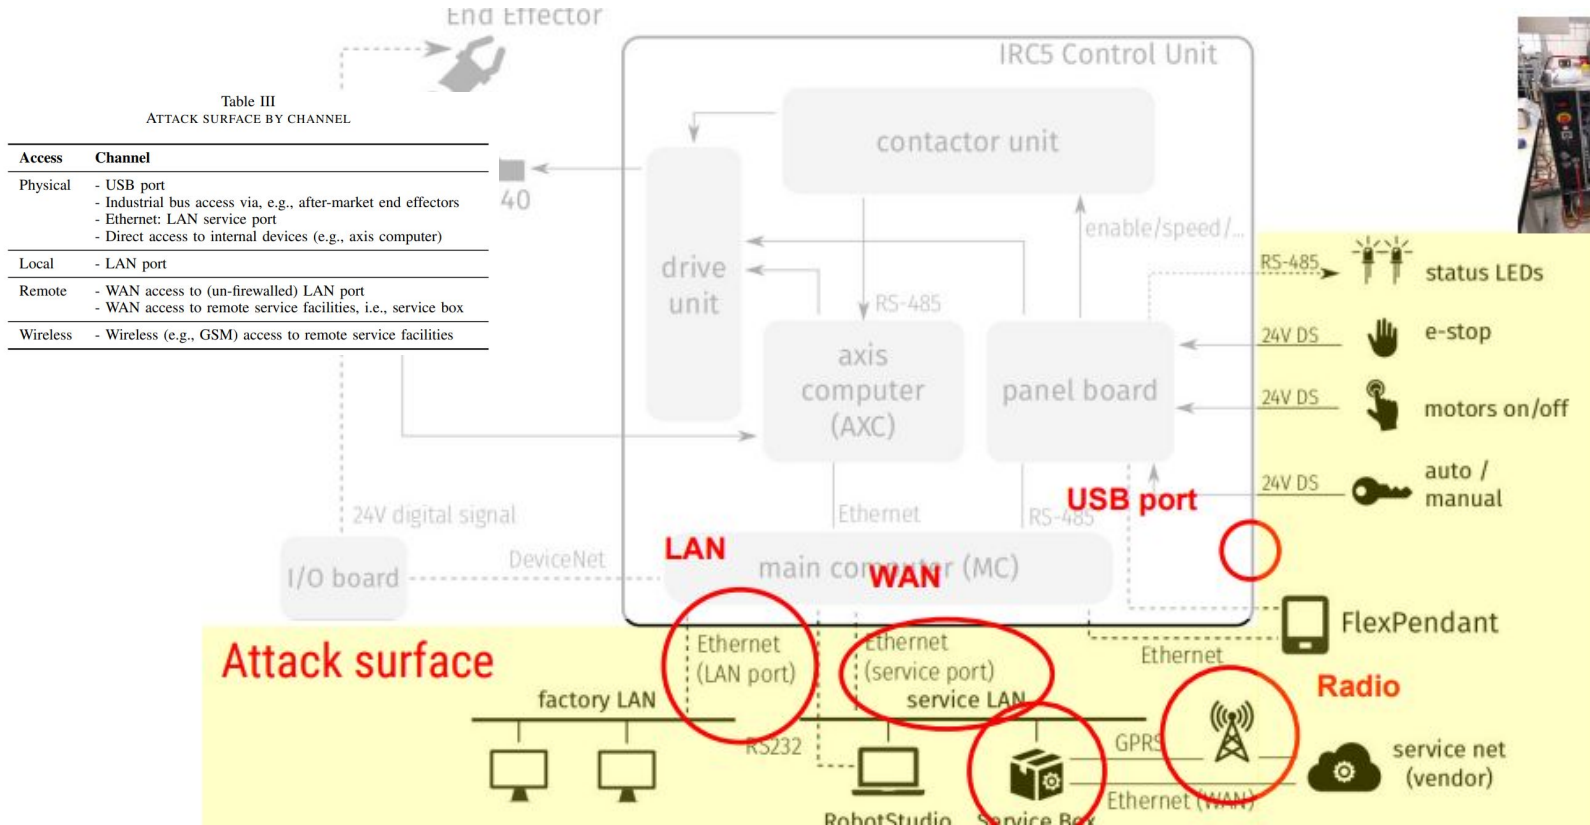

# Case Study

# Case Study

# Case Study

---

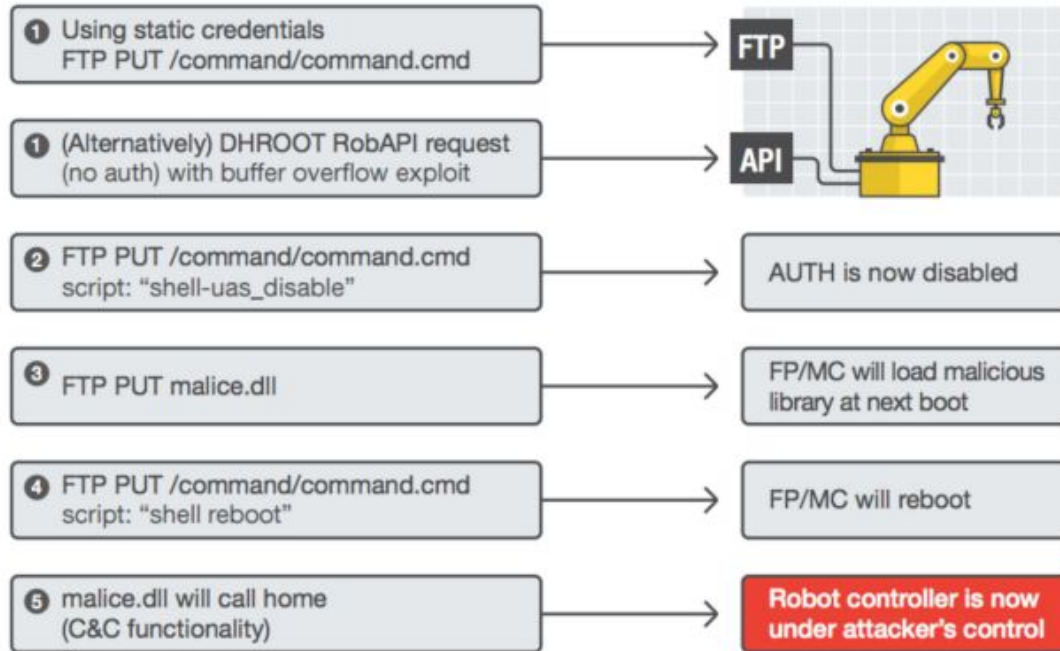

## ❖ Vulnerabilities

- a. **BOF leading to RCE** (ABBVU-DMRO-124641)
- b. **BOF in FlexPendant** (ABBVU-DMRO-124645)
- c. **BOF in /command endpoint** (ABBVU-DMRO-128238)
- d. **Command Injection** (ABBVU-DMRO-124642)
- e. **Authentication bypass** (ABBVU-DMRO-124644)

# Case Study

## ❖ Full Controller Exploitation

# Attack POCs

---

- 1) **Accuracy** Violation: PID parameters detuning (Attack 1) **DEMO**
- 2) **Safety** Violation: User-Perceived Robot State Alteration (Attack 4)
- 3) **Integrity** Violation: Control-loop alteration (Attack 1)

# Attack POCs

---

- ❖ POC 1: Accuracy Violation

# Attack POCs

## ❖ POC 2: Safety Violation

# Attack POCs

---

- ❖ POC 3: Integrity Violation
  - Robot's arm collapse on itself
  - Motors substantially damaged

Quite a risky POC!  
Verified with a robotics' expert

# Discussion & Limitation

---

## ❖ Discussion

- Lack of standards explicitly accounting for cyber–security threats
- Security Measures and Challenges
  - Human interaction, Attack detection, System hardening, Program protection, etc.

## ❖ Limitation

- Cost of Exploit Testing
- Generality
- Survey

# Conclusion

---

- ❖ Conclusion
  - New standards, beyond safety issues
  - Attack detection and hardening
  - Secure collaborative robots
  - (Detailed countermeasures in the paper)

# Best Questions

---

- ❖ **(Mumin Hasan)** What impact do robot-specific vulnerabilities have on broader factory ecosystems (e.g., other connected devices)? Could attackers pivot through compromised robots to access unrelated systems?  
**(Jiwoo Suh)** Attack scenarios on systems utilizing two or more robots and the cascading disasters this attack could cause.
- ❖ **(Jiwoo Suh)** Are there any attacks that could exploit vulnerabilities unique to the robot's hardware or operational behavior (this paper focus more on software vulnerabilities)?

# More Questions

---

## ❖ **Defense methods in robot security**

- Fuzz testing in a simulation environment to mitigate software and hardware vulnerabilities of robots
- Strategies to make software-dependent systems immune to cyber-attacks
- Machine learning techniques to detect and respond to anomalous behavior in industrial robots

## ❖ **Challenges of applying security to a new system**

- Retrofitting legacy industrial systems with modern encryption and authentication mechanisms
- Zero-trust security architectures for industrial environments, and trade-offs in terms of system complexity and performance
- Balance the need for security patching with minimizing downtime
- Difficulties to apply established software development practices to such systems
- Reasons for the use of default credentials persist in industrial setups despite known risks. Factors discourage enforcing stronger authentication (e.g., cost, convenience)
- Cost-benefit trade-offs of implementing mandatory firmware code signing and impact for the operational efficiency of robot programming
